

Multiclient Cumulative Conclusions:

- **Default NFS performance fast especially at 100 Mb/sec.**
- **The double write of AFS & DFS results in significantly slower write performance. Client configurations are very important.**
- **The SSA fast writes aren't as apparent in the NFS/AFS/DFS configurations..**
- **Increased latency of switching is 1 - 5%. This delay would be cumulative through routers, switches, etc.**
- **Reducing the multiclient to server bottlenecks are important.**
- **DFS better on congested networks.**
